Linux Integration Services 3.5 for Hyper-V Readme

Microsoft Corporation
Published: December 2013

Abstract
Hyper-V supports both emulated ("legacy") and Hyper-V-specific ("synthetic") devices for Linux virtual machines. When a Linux virtual machine is running with emulated devices, no additional software is required to be installed. However, emulated devices do not provide high performance and cannot leverage the rich virtual machine management infrastructure that the Hyper-V technology offers. To make full use of all benefits that Hyper-V provides, it is best to use Hyper-V specific devices for Linux. The collection of drivers that are required to run Hyper-V-specific devices is known as Linux Integration Services (LIS).

For certain older Linux distributions, Microsoft provides an ISO file containing installable LIS drivers for Linux virtual machines. For newer Linux distributions, LIS is built into the Linux operating system, and no separate download or installation is required. This guide discusses the installation and functionality of LIS drivers on older Linux distributions. Please refer to Linux Virtual Machines on Hyper-V topics for up to date information on the LIS feature set, all supported Linux distributions, availability and download locations.

Supported Virtualization Server Operating Systems
This version of Linux Integration Services (LIS) supports the following versions of Hyper-V:

• Microsoft Hyper-V Server 2008 R2
• Windows 8 Pro
• Windows 8.1 Pro
• Windows Server 2012
• Windows Server 2012 R2
• Microsoft Hyper-V Server 2012
• Microsoft Hyper-V Server 2012 R2

Note
Supported versions include those updated with Service Pack 1 or Service Pack 2, where available.

Supported Linux Distributions
This version of LIS supports the following legacy guest operating systems:

• Red Hat Enterprise Linux (RHEL) 5.5-5.8, 6.0-6.3 x86 and x64
• CentOS 5.5-5.8, 6.0-6.3 x86 and x64
Note that in comparison to LIS 3.4, LIS 3.5 expands the list of supported distributions to include RHEL/CentOS 5.5-5.6. Also note that this version of LIS only supports limited legacy Linux distributions. Please refer to the Linux Virtual Machines on Hyper-V topics for up to date information on the LIS feature set, all supported Linux distributions, availability and download locations.

Linux Integration Services 3.5 Feature Set

When installed on a virtual machine that is running a supported Linux distribution, LIS 3.5 for Hyper-V provides the functionality listed in the table below. For comparative purposes, we also list the features available in LIS 3.4. This allows users to decide if they want to upgrade from LIS 3.4 to LIS 3.5.

**Notes**
1. Static IP injection might not work if Network Manager has been configured for a given HyperV-specific network adapter on the virtual machine. To ensure smooth functioning of static IP injection, ensure that either Network Manager is turned off completely, or has been turned off for a specific network adapter through its ifcfg-ethX file.

2. When you use Virtual Fibre Channel devices, ensure that logical unit number 0 (LUN 0) has been populated. If LUN 0 has not been populated, a Linux virtual machine might not be able to mount Virtual Fibre Channel devices natively.

3. If there are open file handles during a live virtual machine backup operation, the backed-up virtual hard disks (VHDs) might have to undergo a file system consistency check (fsck) when restored.

4. Live backup operations can fail silently if the virtual machine has an attached iSCSI device or a physical disk that is directly attached to a virtual machine ("pass-through disk").

5. LIS 3.5 only provides Dynamic Memory ballooning support—it does not provide hot-add support. In such a scenario, the Dynamic Memory feature can be used by setting the **Startup memory** parameter to a value which is equal to the **Maximum memory** parameter. This results in all the requisite memory being allocated to the virtual machine at boot time—and then later, depending upon the memory requirements of the host, Hyper-V can freely reclaim any memory from the guest. Also, ensure that Startup Memory and Minimum Memory are not configured below distribution recommended values.
Installing Linux Integration Services 3.5

To install Linux Integration Services 3.5:

1. Open Hyper-V Manager.
2. Create a new virtual machine where you will install Linux: In the Actions menu, click New, and then click Virtual Machine.
3. Specify the Linux installation media: Right-click the virtual machine that you created, and then click Settings. In IDE Controller, specify one of the following:
   - An image file in ISO format that contains the files required for installation
   - A physical CD/DVD drive that contains the installation media
4. Turn on the virtual machine: Right-click the virtual machine that you created, and then click Connect.
5. Begin installing Linux.
6. When prompted, restart the virtual machine and complete any first-boot configuration tasks.
   
   **Note**
   
   Unless a legacy network adapter was added during the virtual machine’s initial configuration, the virtual machine will not have any network support.
7. Log on to the virtual machine.
8. In Hyper-V Manager, configure LinuxICv35.ISO (located in the directory where you extracted the downloaded files) as a virtual CD/DVD drive on the virtual machine.
9. After it is configured, LinuxICv35.ISO should appear mounted under /media/CDROM if automount is enabled. If automount is not enabled, then use the following command to mount the ISO file:

   ```
   # mount /dev/cdrom /media
   ```

10. As the root user, change to the directory relevant to your distribution: For RHEL / CentOS 5.5:

    ```
    # cd /media/CDROM/RHEL55
    ```

    For RHEL / CentOS 5.6:

    ```
    # cd /media/CDROM/RHEL56
    ```

    For RHEL / CentOS 5.7:

    ```
    # cd /media/CDROM/RHEL57
    ```

    For RHEL / CentOS 5.8:

    ```
    # cd /media/CDROM/RHEL58
    ```

    For RHEL / CentOS 6.0, 6.1, 6.2:
For RHEL / CentOS 6.3:

```
# cd /media/CDROM/RHEL6012
```

11. Run the following command to install the Hyper-V-specific (or “synthetic”) drivers. A reboot is required after installation.

For RHEL / CentOS 5.5:

```
# ./install-rhel55.sh
```

For RHEL / CentOS 5.6:

```
# ./install-rhel56.sh
```

For RHEL / CentOS 5.7:

```
# ./install-rhel57.sh
```

For RHEL / CentOS 5.8:

```
# ./install-rhel58.sh
```

For RHEL / CentOS 6.0, 6.1, 6.2:

```
# ./install.sh
```

For RHEL / CentOS 6.3:

```
# ./install.sh
```

---

**Upgrading to Linux Integration Services 3.5**

▲ To upgrade to LIS 3.5 from LIS 3.4:

1. Open Hyper-V Manager.
2. In Hyper-V Manager, configure **LinuxICv35.ISO** (located in the directory where you extracted the downloaded files) as a virtual CD/DVD drive on the virtual machine.
3. After it is configured, **LinuxICv35.ISO** should appear mounted under `/media/CDROM` if automount is enabled. If automount is not enabled, then use the following command to mount the ISO file:

```
# mount /dev/cdrom /media
```
4. As the root user, change to the directory relevant to your distribution:

For RHEL / CentOS 5.7:

```
# cd /media/CDROM/RHEL57
```

For RHEL / CentOS 5.8:

```
# cd /media/CDROM/RHEL58
```

For RHEL / CentOS 6.0, 6.1, 6.2:
Verifying Linux Integration Services 3.5 Functionality

LIS provides support for the `modinfo` command. To get module information for each installed kernel module, run the following command:

```bash
# /sbin/modinfo hv_vmbus
```

```bash
filename: /lib/modules/2.6.32-71.el6.x86_64/extra/microsoft-hyperv/hv_vmbus.ko
version: 3.5
license: GPL srcversion: ACE0AA64B58744D00E54C12
alias: acpi*:VMBus:* alias: acpi*:VMBUS:*
depends: vermagic: 2.6.32-71.el6.x86_64 SMP mod_unload
```

This command can be repeated for all kernel modules (`hv_vmbus`, `hv_netvsc`, `hv_storvsc`, `hv_blkvsc`, and `hv_utils`).

To verify that all subcomponents are running as the root user, run the following command:

```bash
# /sbin/lsmod | grep hv
```

The output should include lines similar to the following:

```bash
hv_balloon      10538 0 [permanent] hv_netvsc     24309 0
hv_utils        9499 0 hv_timesource  1079 0 [permanent]
hv_storvsc      11641 2 hv_vmbus        146721 7
```

```bash
hv_balloon,hid_hyperv,hv_netvsc,hv_utils,hv_timesource,hyperv_fb,hv_storvsc
```

**Note**

Your file system type or other local factors might result in different file sizes in your deployment.
• “hv_balloon” provides Dynamic Memory support for virtual machines.
• “hv_netvsc” provides support for a Hyper-V-specific (or “synthetic”) network adapter.
• “hv_utils” provides integrated shutdown, key-value pair data exchange, heartbeat, mouse and live backup.
• “hv_timesource” is the pluggable time source module to assist in accurate timekeeping in the virtual machine.
• “hv_storvsc” provides support for all storage devices attached to a virtual machine.
• “hv_vmbus” is the fast communication channel between the server running Hyper-V and the virtual machine.

Using Key-Value Pair (KVP) Exchange with a Linux Virtual Machine

After LIS is installed on the virtual machine, key-value pair functionality is activated. This allows the virtual machine to provide the following information to the virtualization server:

• Fully qualified domain name of the virtual machine
• Version of LIS that is installed
• IP addresses (both IPv4 and IPv6) for all Ethernet adapters in the virtual machine
• Operating system build information, including the distribution and kernel version
• Processor architecture (x86 or x86-64)

The data can be viewed using the Hyper-V WMI provider, and accessed through Windows PowerShell. Instructions for viewing key-value pair exchange data are available at these websites:

Configuring the Hyper-V-specific Network Adapter in Red Hat Enterprise Linux

Use the network configuration tool (in System/Preferences/Network Connections) to configure the newly installed Hyper-V-specific (or “synthetic”) network adapter. Configure the virtual Ethernet adapter, which is a Hyper-V specific network card with enhanced performance. After successful
configuration, eth0 should appear in the output of the `ifconfig` command, similar to the following example:

```
/sbin/ifconfig  eth0         Link encap:Ethernet HWaddr 00:15:5D:01:08:77
```

Alternatively, you can manually configure the network device to obtain an address through DHCP as follows. Note that if the file does not exist in step 1 or step 2, you will need to create the file.

1. Modify `/etc/sysconfig/network` to enable networking.
   ```
   NETWORKING=yes
   ```
2. Create `/etc/sysconfig/network-scripts/ifcfg-eth0`.
   ```
   DEVICE=eth0
   ONBOOT=yes
   BOOTPROTO=dhcp
   ```
3. Bring up the eth0 interface.
   ```
   ifup eth0
   ```

## Configuring the Hyper-V-specific Storage Controller in Red Hat Enterprise Linux

To configure the Hyper-V-specific (or “synthetic”) storage controller:

1. If you have a SCSI disk attached, as the root user, run the following command:
   ```
   # cat /proc/scsi/scsi
   ```
   This displays the information for the Hyper-V-specific SCSI controller.
   ```
   Attached devices:
   Host: scsi0 Channel: 00 Id: 00 Lun: 00 Vendor: Msft Model: Virtual Disk Rev: 1.0
   Type: Direct-Access ANSI SCSI Revision: 04
   ```
   This indicates that the Hyper-V-specific SCSI controller has been enumerated correctly.
2. Next, as the root user, run the following command to verify that there are disk(s) attached to the SCSI controller:
   ```
   # ls /dev/sd*  brw-r----- 1 root disk 8,0 Nov 27
   17:25 /dev/sda
   ```
3. After you confirm the presence of the disk(s), use the `fdisk` tool (as the root user) to create a partition on the disk.
Uninstalling Linux Integration Services

To uninstall LIS, run the following steps:

1. `rpm -qa | grep microsoft`

   Example: On a RHEL 6.0 system, you will see the following:

   ```
   # rpm -qa | grep microsoft
   microsoft-hyper-v-rhel6012.3.5-1.20131031.x86_64
   ```

2. `rpm --remove microsoft-hyper-v-*version string from step 1>* kmod-microsoft-hyper-v-*version string from step 1>`

   Example: On a RHEL 6.0 system, you may invoke:

   ```
   # rpm --remove microsoft-hyper-v-rhel6012.3.5-1.20131031.x86_64
   ```

Source Code for Linux Integration Services 3.5

You can access LIS 3.5 source code in two ways:

a) **Source RPMs on the LIS 3.5 ISO.** All LIS 3.5 source code is available inside the LIS 3.5 ISO. In the folder for each distribution, you should see a `Src.rpm` file. As an example, in the folder RHEL58, you should see a file named `Microsoft-hyper-v-3.5-1.20131102.src.rpm`. This rpm can be installed using the `rpm --install microsoft-hyper-v-3.5-1.20131102.src.rpm` command, and then you can browse the source code for RHEL 5.8 at `/root/rpmbuild`. Similar src.rpm files exist for all distributions supported by LIS 3.5.

b) **GitHub repository for LIS 3.5.** To simplify code access, we have also created a GitHub repository for LIS 3.5. The link to the repository is: [https://github.com/LIS/LIS3.5](https://github.com/LIS/LIS3.5)

Additional Information About Linux Integration Services 3.5
Release Notes

- To mount an ISO file in the virtual machine, you must run the following command before running the `mount` command:

  ```bash
  # insmod /lib/modules/$(uname -r)/kernel/drivers/ata/ata_piix.ko
  ```

  Alternatively, copy the ISO file into the virtual machine and mount it using the `-o loop` option.

- Formatting a VHDX file with an ext3 file system might fail. To work around this issue, either use an ext4 file system, or create the .VHDX file with a smaller block size, such as 1 MB. Using the ext4 file system is recommended for production deployments of Linux on Hyper-V.

- Windows Server 2012 includes support for 4K sector size disks. However, the use of 4K drives is limited to Linux kernels that support it. Red Hat Enterprise Linux (RHEL) did not include support for 4K drives until version 6.0.

- The command `lsmod | grep hv_` might not list the `hv_netvsc` driver. This occurs if the virtual machine is not configured with a Hyper-V-specific network adapter. The `hv_netvsc` driver is loaded only if a Hyper-V-specific network adapter is detected. Similarly, the `hv_balloon` driver might not show up in the list if Dynamic Memory has not been configured for the virtual machine.

- The Hyper-V bridge.sys driver is not compatible with all Wi-Fi routers. This may result in a virtual machine not receiving an address through DHCP. This only occurs if the virtual machine’s virtual switch is bound to a wireless network adapter and the Wi-Fi router is incompatible with bridge.sys. This issue does not occur when the virtual switch is bound to a wired network adapter.

  The following steps can be used to work around the issue:

  1. Configure the Wi-Fi router to assign a static IP address to the host’s wireless network adapter.
  2. On the host, configure the wireless network adapter to use a static IP address. The IP address will be the same address that was configured in step 1.
  3. Using the Hyper-V Manager, create an external virtual switch that is bound to the host’s wireless network adapter.

- To ensure all disks connected to the virtual machine are seen, all disks connected to a SCSI controller must start with location "0".

- If a disk was hot-removed from the system, the connected disks will not be rescanned until a new I/O is initiated.

- If you would like to use `kdump` functionality on a server running Hyper-V released prior to Windows Server 2012 R2, then configure `kdump` before installing LIS. No preconfiguration of `kdump` is required if you are running virtual machines on Windows Server 2012 R2.

- You might see entries in `/var/log/messages` similar to the following:

  ```
  [ 44.870261] STORVSC: WARNING! cmd 0x12 scsi status 0x2 srb status 0x4
  ```

  These messages can be safely ignored.
• Virtual machines configured to use more than 7 virtual processors should add “numa=off” to the GRUB boot.cfg to work around a known issue in the Linux kernel. This is a due to a known issue on 2.6.x Linux kernels.

• Virtual machines configured to use more than 30 GB RAM should add “numa=off” to the GRUB boot.cfg.

• If LIS is removed from a virtual machine configured to use more than one virtual processor, then the irqbalance service should be disabled to allow successful shutdown of the virtual machine.

• The ISO file also contains a .src.rpm (Source RPM) and debugging RPM. The debugging information should not be used unless instructed by Microsoft Support.

• This version of LIS no longer includes the Hypercall adapter that was present in earlier versions.

• Verifying the digital signature of the RPM packages under Red Hat Enterprise Linux (by running the `rpm -K` command) will return a “KEYS ARE NOT OK” message.

• Support for this version of LIS is provided through the Microsoft TechNet forums (http://social.technet.microsoft.com/Forums/windowsserver/enus/home?forum=linuxintegrationservices), or by contacting the appropriate support channels for Microsoft or Red Hat.

• On AMD 4100 and 6000 series, you might see panics while booting RHEL 5.5 on Hyper-V. This is due to an issue in the Linux kernel, and Red Hat has addressed it here: https://access.redhat.com/site/articles/37935

• If both legacy and Hyper-V-specific (“synthetic”) network adapters are attached to a virtual machine, then the network names in the output of “ifconfig –a” might show random values such as “__tmp12000801310”. To avoid this issue, remove all legacy network adapters when using Hyper-V-specific network adapters in a Linux virtual machine.

• While running LIS 3.5, you might see the following entries in Hyper-V event logs on the host:
  o Networking driver on ‘Virtual Machine’ loaded but has a different version from the server. Server version 3.2 Client version 2.0 (Virtual machine ID DC1CCF5C-0C1A-4825-B32C9A4F8F85AA9D). The device will work, but this is an unsupported configuration. This means that technical support will not be provided until this problem is resolved. To fix this problem, upgrade the integration services. To upgrade, connect to the virtual machine and select Insert Integration Services Setup Disk from the Action menu.

  o A storage device in ‘Virtual Machine’ loaded but has a different version from the server. Server version 4.2 Client version 2.0 (Virtual machine ID DC1CCF5C-0C1A-4825-B32C9A4F8F85AA9D). The device will work, but this is an unsupported configuration. This means that technical support will not be provided until this problem is resolved. To fix this problem, upgrade the integration services. To upgrade, connect to the virtual machine and select Insert Integration Services Setup Disk from the Action menu.

Users can safely ignore these entries. Microsoft will provide the requisite technical support even if these entries are logged in the system.
Features Not Available

The following features are not available in this version of LIS:

• Dynamic Memory hot-add support
• TRIM support
• TCP offload
• vRSS

Important Considerations for Making Linux Virtual Machines Highly Available in Failover Clustering and Hyper-V

Linux virtual machines that will be deployed in a highly available scenario (using Failover Clustering) should be configured with static MAC addresses for each virtual network adapter. Because of the way Linux configures the network adapter, in some versions of Linux, it is possible that the networking configuration will be lost after failover because a new MAC address might be assigned to the virtual network adapter. To work around this issue, ensure that each virtual network adapter has a static MAC address by editing the settings of the virtual machine in Hyper-V Manager.
